As EMS continues to implement more technology, it's important to make medical records safe, but easily accessible via electronic means. MyHealth provides this service, allowing people to wear QR codes that can lead EMS practitioners directly to a patient's emergency contacts, medical records, health diary and photo journal, providing key information at the click of a button.

The information is securely stored online, PIN protected and kept safe with industry-leading technology.

**Rod Maxson, CEO of My Academy of Health Excellence, a medical expense cost-sharing plan, provides MyHealth automatically to all members.**

Maxson says he has been providing this service since about April, and has been very satisfied thus far.

**"We have had zero complaints, and we see more opportunities to use them beyond cost control and emergency assistance," Maxson says. "We'll be rolling them out to more associations soon."**

Maxson says his organization provides unique life codes for all their members on their key cards, and each code includes access to the MyHealth.us 800 number and a unique QR code for each member.

**"If scanned or called, MyHealth assists our members with collecting and storing all of their medical records," Maxson says. "It tracks how they are feeling, what medications they take and links our members and first responders to medical services nearby or online."**

MyHealth was easy to implement into his organization, Maxson says, and took less than 30 days to provide life codes to all members.

Maxson says his members have been satisfied with the product as well, enjoying its ease of use and the ability to track health conditions like glucose levels, doctors visits or exercise programs.

**"It's fast, it's inexpensive and it works," Maxson says. "With it, we are saving lives."**
